# Migration outcomes & resume

Three honest terminal states  
pending  $\neq$  failed · every state resumable

## AFTER “MIGRATING...” — THE EXECUTOR RESOLVES TO EXACTLY ONE OF THREE STATES

- Complete

All transactions confirmed. Session cleared. User is sent to Helium World.
- Pending — still confirming

A status poll timed out with transactions still **pending** (not failed). Confirmed items are safe; session stays **running** & resumable. No false-failure framing.
- Partial — real failures

One or more transactions **terminally failed** (failed / expired). Confirmed items kept; only the failures retry. Idempotent re-run of the persisted input.

**Resume path** — on relaunch, a persisted session routes by outcome: real failures → **Almost there** (retry); nothing failed (interrupted mid-confirm, or timed-out pending) → **Still processing**. A **running** snapshot is written *before* the first batch confirms, so even a kill during batch 1 stays resumable. Counts (moved / failed) are surfaced from the session — never a bare 0 / 0.

**Non-destructive by construction**  
Destination is the user's own wallet. Source keeps its keys. Only **MIGRATABLE\_MINTS** move; unresolvable mints are dropped, never shipped as a corrupted raw amount.

**pending  $\neq$  failed**  
**summarizeBatch** splits **pending** from terminal-failed. A slow confirmation is “still processing,” never a retry screen — no phantom failures.

**Amount safety**  
Integer-string math only, no float. **uiToRaw("5.7", 0) → "5"** — the fractional part is truncated, not concatenated, on the funds-moving path.

**Open everyone-first**  
No eligibility gate. Email OTP → auto-created embedded wallet, or connect an external self-custody wallet. Fees presented as Free.
